

(2). We launched a EC2 machine where we installed Jenkins. Next we configured Jenkins to be connected to our AWS account and Github account. This enabled Jenkins to communicate with AWS services like the Elastic Beanstalk and to be synced up with our Github. With this configuration, we deployed our flask app. The following took place: We pushed the app code to github, Jenkins build jobs where span up that run Elastic Beanstalk which deployed all the services needed for our app to AWS.
